

VISITOR MANAGEMENT SYSTEM USING SERVICENOW

Objective

The objective of the Visitor Management System (VMS) project is to automate and streamline the process of managing visitor registrations within an organization. The application enables visitors to submit visit requests, allows administrators to approve or reject requests, records visitor check-in and check-out activities, sends automated email notifications, generates reports and dashboards, and provides a centralized platform for tracking visitor information. The system improves security, reduces manual paperwork, enhances visitor tracking, and ensures efficient management of visitor activities through an automated workflow built on the ServiceNow platform.

Milestone 1: Project Planning and Environment Setup

Objective

To prepare the ServiceNow development environment and establish the foundation for the Visitor Management System (VMS) application. This phase includes setting up the ServiceNow instance, creating the scoped application, and planning the database structure required for managing visitors and employee hosts.

Step 1: Create Personal Developer Instance (PDI)

1. Visit developer.servicenow.com.
2. Sign in or create a developer account.
3. Request a Personal Developer Instance.
4. Wait for instance activation.
5. Login using admin credentials.

The screenshot displays the ServiceNow Developer portal interface. At the top, there is a navigation bar with links for MyNow, Products, Industries, Learning, Support, Partners, and Company. Below this, a secondary navigation bar includes Developer, Home, Learn, Reference, Guides, and Connect. The main content area is titled 'Manage my instance (dev391526)' and features several sections:

- Status:** Shows the instance is 'Online' with a 'Refresh' button. Below this, it lists installed components: Build agent, ServiceNow studio, and App engine studio, all marked as 'Installed'. It also shows the current version as 'Australia' with a link to the 'Latest release'.
- Instance URL:** Provides the URL <https://dev391526.service-now.com/>.
- User Information:** Displays the user name 'admin', a masked current password, and the user role 'Admin'.
- Useful links:** A sidebar with links to the 'Personal Developer Instance (PDI) Guide', 'PDI FAQs', 'Managing your PDI', and 'Developer advocate blog'.
- Plugins for your instance (45):** A section with filters for 'All activation statuses' and 'All demo data statuses'. It lists several plugins, all marked as 'Not activated':
 - Activate all Software Asset Management Professional plugins
 - Cloud Management
 - Customer Service Virtual Agent Conversations
 - Discovery
 - Domain Support - Domain Extensions Installer
 - ECC Queue Retry Policy

Step 2: Create Scoped Application

Navigation:

System Applications → Studio

1. Open Studio.
2. Select Create Application.
3. Enter:
 - Application_Name
Visitor Management System
 - Scope: Auto-generated by ServiceNow
4. Click Create.

CREATE APP

Let's get started on your new app.

Add a name and description that define the purpose of your app. You can also add a thumbnail image.

Learning Outcomes

- Understood ServiceNow architecture and application development lifecycle.
- Created and managed a scoped application.
- Configured the ServiceNow development environment.
- Learned ServiceNow Studio fundamentals.
- Understood table creation and relationship management.
- Gained experience in designing custom applications.
